Detection at ALPS I and ALPS II Transition-Edge Sensor (TES) TES detector for ALPS Signal and Noise(s) Conclusion and Outlook

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ ─ 臣

ALPS I – a promising starter

ALPS I experiment at DESY site Hamburg, 2009

- green laser, production cavity, one HERA magnet
- ▶ Piezo-cooled Si-CCD (96% QE at 532 nm) with 1h data/dark frames
 - dark current dominates (10^{-3} e/s) over read-out noise
 - limited by background
- exemplary result:

 $\gamma_{\rm in} \sim K$. Ehret. e

$$10^{21} \frac{1}{s} \frac{1}$$

ALPS II - lower the limit!

ALPs:
$$g < \frac{1}{BL} \sqrt[4]{\frac{\gamma_{\mathrm{out}}}{\gamma_{\mathrm{in}} \times \epsilon}} \frac{1}{F(...)}$$

Three steps at ALPS II

- laser power resp.
 photon flux (1064 nm)
- regeneration cavity
- length of experiment (up to 200 m)

Improve sensitivity of detector

- Challenge: detection of low rates of single infrared photons (< 1/h)</p>
- Requirements: High efficiency and low (dark) noise and background

Detector impact on ALPS II sensitivity

 $\mathsf{gain}=1$

・ロト ・ 理 ト ・ ヨ ト ・ ヨ ト

- ALPS I, 532 nm
- ▶ QE = 90%
- 27h exposure
- ► $DC = 0.0012s^{-1}$

ALPS II, **1064 nm**

- ► CCD QE = 1.2%
- ▶ TES QE = 75%

Working principle of TES detector

P.A.J. De Korte et. al., Tes x-ray calorimeter-array for imaging spectroscopy. Proceedings of SPIE, pages 779-789, 2002

イロト 不得 トイヨト イヨト

-

Technical realizations and applications Some examples:

- Calorimeter: Direct Dark Matter Search (e.g. CRESST II)
- Calorimeter: X-ray & gamma spectroscopy
- Bolometer: mm/sub-mm wave in astronomy
- Microcalorimeter: single photon counter (near-infrared) for quantum-information (1310/1550 nm)

This fits to ALPS:

- optical to near-infrared sensitivity
- Time/energy res.: $\sim 1 \mu {
 m s} / {\sim}$ 0.1eV
- Detection efficiency up to 99%
- No intrinsic dark noise, but th./el. noise and background like black-body photons!

Brief history: TES for ALPS

- before 2011: ALPS with no experience in TESs, SQUIDs, mK-cryogenics.
- early 2011: first touch with SQUIDs and "TES photons" at PTB, Berlin
- mid/end 2011: measurements in Camerino, Italy
 - DR cryostat
 - two low-efficiency TES chips (NIST and INRIM)
 - SQUID array and electronics, Magnicon
 - $\rightarrow~$ SQUID operation, TES transition, photon event
- mid 2011: meeting the TES community at LTD 14
- end 2012: mK-environment for ALPS: ADR, Entropy
- end 2012: exchange with Zeilinger group
- early 2013: characterization of high-efficient TES (each with PTB 2-stage SQUIDs)
 - fiber-coupled (glued) AIST (Ti/Au) TES
 - fiber-coupled (FC) NIST (W) TES
- now: TES-signals in ALPS lab

Cryostat for ALPS

Adiabatic Demagnetization Refrigerator (ADR)

- Pulse-tube cooler: in ~20h to 2.5K
- recharge time 1-2h
- lowest temperature ~30mK
- hold time
 24-60h

NIST module for ALPS

- two channels
- PTB dc 2-stage
 SQUID
- NIST TES: 25x25µm, W (doped), Tc ~140mK, QE>99%
- Coupling: 15-30nH

(日)、

 Optics: sleeve to connect SM fiber, losses <1%

ъ

0.2s sample with bad coupled test laser (1066.7nm)

◆ロト ◆昼 ト ◆臣 ト ◆臣 ト ● ● の Q ()・

Fiber could see thermal photons...

Conclusion and Outlook

Conclusion

- After a long time TES detector is running in ALPS-IIa lab!!
 - ADR is running
 - SQUID is under control
 - TES sees single photons
- First look at background: quite good!

Outlook

- Optimization of SQUID, TES working point
- Optimization of system bandwidth
- (longterm) background measurements
- Data analysis with optimal filter
- Efficient coupling to ALPS-Axion beam

End and Backup

AIST poster: fiber as blackbody

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ○ □ ○ ○ ○ ○

Backup: How can we lower the limit?

- ▶ photon rate: $\dot{\gamma}_{meas} = \dot{\gamma}_{in} \times P_{\gamma \rightarrow WISP \rightarrow \gamma} \times \epsilon$
- ► conversion probability: $P_{\gamma \to \text{WISP} \to \gamma} \sim (gBL)^4 F(\frac{M^2L}{4\omega})$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• results in:
$$g < \frac{1}{BL} \sqrt[4]{\frac{\gamma_{\text{out}}}{\gamma_{\text{in}} \times \epsilon}} \frac{1}{F(...)}$$

NIST TES simulated light absorption

Concept for TES with SQUID readout

TES input circuit

Current divider $R_{\text{TES}}/R_{\text{SH}} = I_{\text{SH}}/I_{\text{TES}} = I_{\text{BIAS}}/I_{\text{TES}} - 1$

Current noise $\sqrt{S_I} = 4 k T / R$

Important formulas $I_{\text{TES}} = V_{\text{out}} \cdot \frac{M_{\text{in}}^{-1}}{R_{\text{f}} M_{\text{f}}^{-1}}$ Voltage-biased ($R_{\text{TES}} \gg R_{\text{PAR}} + R_{\text{SH}}$): $V_{\text{TES}} = I_{\text{BIAS}} R_{\text{SH}}$

2-stage SQUID with TES input and characteristics

Values

TES input circuit

TES AIST specs (Channel A)

```
\begin{array}{l} {\rm meas.:} \; R_{\rm SH} = 22 \, {\rm m}\Omega \\ {\rm meas.:} \; R_{\rm TES} = R_{\rm N} = 3.7 \, \Omega \\ {\rm meas.:} \; T_{\rm C} \sim 303 \, \dots \, 317 \, {\rm mK} \\ {\rm meas.:} \; R_{\rm PAR} = 7.5 \, {\rm m}\Omega \\ {\rm estim.:} \; L = 15 \, \dots \, 20 \, {\rm nH} \end{array}
```

SQUID specs

datasheet.: $M_{\rm in} = 5.5 \,\mu {\rm A}/\phi_0$ working point: 2nd-stage: $I_{\rm b}$, $V_{\rm b}$, Phi_b 1st-stage: I, Phi_X meas. (at 100mK): $M_{\rm f} = 54.1 \,\mu {\rm A}/\phi_0$ (adj.: $R_{\rm f} = 100 \,\mathrm{k}\Omega$) (adj.: GBP = 7.2 GHz)
